Job Demand & Wages Skills & Training Find Jobs & Information

Occupation is demand for the following region: Statewide

Architects - Overview

Architects plan and design all types of buildings and structures. Architects design many kinds of structures. Projects may include:

- Houses
- Schools
- Hospitals
- Bridges
- Airports
- Office Buildings
- Renovations

Architects take part in every phase of a building project. They help create the first design and stay involved until the construction clients select building sites. They work with many other people during this process, including the client, engineers, and general contractors. Before beginning a new building design, architects meet with clients. They find out the clients' needs and their ideas for the design. Architects prepare initial drawings and estimate costs and timeline for the project. With the client's approval, architects draw or use computers to develop detailed plans. These plans include scaled drawings and building details. Architects work with drafters and engineers to complete the detailed plans.
